}

Plan: 11 to add, 0 to change, 0 to destroy.

Warning: Value for undeclared variable
The root module does not declare a variable named "subnets" but a value was found in file "terraform.tfvars". If you meant to use this value, add a "variable" block to the configuration.
To silence these warnings, use TF_VAR_... environment variables to provide certain "global" settings to all configurations in your organization. To reduce the verbosity of these warnings, use the -compact-warnings option.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if you run "terraform apply" now.
